

WATERING SOLUTIONS

OUR GRASS IS ALWAYS GREENER

If you're looking for the most efficient, effective way of watering your lawn and landscape, the irrigation experts at James Valley Landscape Solutions can provide you with the proper installation, the right equipment and even some smart technology to keep your water bill under control while allowing for healthy, beautiful landscaping.

Sprinkle In Some Science

Watering is actually a lot more scientific than just turning on a sprinkler. The right amount at the right times can make an amazing difference. We can help with smart irrigation systems that can actually detect rain and other environmental factors and will shut off when your lawn has adequate moisture or when there is moisture in the air. With a self-monitoring sprinkler or drip water system, you can see significant savings on your water bill and enjoy a gorgeous lawn, plants, trees and bushes even on the hottest days of summer.

Professional Maintenance and Installation

In-ground water and garden sprinkler systems use a series of sprinkler heads installed at fixed locations in the yard. When properly installed and maintained, in-ground systems give complete, automatic coverage. These systems can be installed in new or existing yards and are ideal for commercial locations. The irrigation specialists at James Valley Landscape Solutions are also here to maintain your system in the spring and fall and can troubleshoot and repair any problems.

Irrigation Audit

If you would like to see if your current system could be operating more efficiently, we can provide you with an audit that identifies ways for you to irrigate smarter using the most advanced technology and tools in the business.

Let's get started

Schedule a free irrigation system audit or estimate by calling, emailing or stopping by James Valley Landscape Solutions to discuss your project with our professionals today.
